The INDIVIDUA® system guarantees precise transfer, also reducing chair side time during bonding procedure. The two-layer structure with its very thin inner layer provides accurate fit of the bracket in the tray, ensuring high stability in positioning and thus precise transfer in clinical application.

In case of the loss of a bracket, the corresponding tooth segment is cut off the tray and reused as single tray. The bracket will be inserted in this single tray and bonded as usual.

Another asset of the INDIVIDUA® LAB BOND system in comparison with similar systems: its fabrication is quick and simple. You’ll succeed in fabricating the transfer tray in a few minutes thanks to effective production steps and specific material.
